PACE control plane: per-turn decisions of a frozen ReAct harness factored into a priced, gated linear controller

Host = CRMArena-Pro (harness version crmarena-pro-v1). Only the controller and its price lambda learn; the harness, the tiers and the scorer never change.

LEGEND

- frozen: harness, models, benchmark scorer, rubric
- learned: controller, adapter, weights, notes
- signal under test: reward model, verifier, probe, proxy, writer
- logged data: traces, propensities, ledger, prompts
- gate / cap / fail-closed / shift
- offline trainer, estimator, metric
- measured result

** = proposed or not run; dashed = not exercised on real data*
